FGOAC scooby - Player Guide

FGOAC scooby is an English fan patch and launcher for the FGO Arcade local platform (Cloud23333's package). This guide covers install, first run, how to get Servants, controls, and troubleshooting.

What this is

FGOAC scooby puts the FGO Arcade game itself into English - menus, tutorial, story text, battle screens, shops, help - and replaces the platform's front end with an English launcher of the same name. It is not a game download: it needs an existing FGO Arcade local platform install (Cloud23333's package at V1.01 or V1.02, with or without his latest update) and is applied on top of it.

Requirements

Requirement	Notes
Platform	Cloud23333's FGO Arcade local platform at **V1.01 or V1.02**, with or without his latest update. V1.02 is the one to be on: it fixes ERROR 4102, the blank Servant records and the sync error after enhancing a Servant
OS	Windows 10 or 11, 64-bit
GPU	NVIDIA on a current driver. AMD and Intel: a compatibility layer, picked under Graphics layer on Settings > Display. Cloud23333's layer from his latest update is the default, on his update and without it; the layer FGOAC scooby shipped with 1.1.0 and fluphus's AMD layer are there to choose. All are community work and not fully optimized yet, so expect lower frame rates and some rendering errors than on NVIDIA
CPU	Intel Core 3rd generation (2012) or newer, or any Ryzen. Pentium and Celeron chips before the 12th generation lack F16C, an instruction set the game uses, and stop with 0xC000001D at start
.NET / Python	Not needed - both are bundled with the install
PowerShell	5.1 (built into Windows) or 7
Rights	Administrator (one UAC prompt)
Drive	Any drive except **E:** or **Y:**

Install

1. Unzip the FGOAC scooby package into your FGO Arcade folder - the one that holds `App` and `Server`.
2. Run **FGOAC scooby.exe**.
3. Click **Yes** on the Windows permission prompt.

The first start does the rest: it installs the English files, checks that the game can write to its folders, creates the account **Master** with a full Servant and Craft Essence roster, and sets the display to windowed 1280x720 on the primary monitor. Then press **Play**; the game takes about a minute to reach the title screen. Later starts skip all of that and go straight to Play.

First run and the launcher

The launcher has these pages in its sidebar:

- **Play** - the game on this PC: the Play and Stop buttons, the Status sentence with the next step beside it, and the Master line: click it for the Master menu (switch accounts, New account). This is the page to leave open while the game runs.
- **Cards** - the card library (searchable, with official English names and Craft Essence effects) and deck editor, plus the Draw Rates page.
- **Photo Mode** - the photo mode panel, live while the game runs.
- **Mods** - the MOD folder of Cloud23333's latest update, App\1_MOD.
- **Events** - which limited-time events the server on this PC offers.
- **Accounts** - also opened with **Manage** beside the Master line: create, select, or delete local accounts, and grant a Servant, Craft Essence, or item pool to the selected one with one click (One-Click Inventory and Growth).
- **Battle Debug** - battle test switches for local play, including Stop the battle timer.
- **Controls** - input (keyboard, XInput, DualSense; with Cloud23333's latest update also his keyboard battle mode and its mouse camera, his controller camera, card selection and controller mouse; and a switch that keeps the mouse inside the game window), bindings, and the cursor (size, outline, position and the mouse button that taps the screen).
- **Settings** - display (monitor, resolution, aspect ratio, frame rate, a graphics card pick, widescreen), battle effects (hide the screen during Noble Phantasms, hide the white flash, an opacity slider), audio, PC play (the continue window, popups, the GP purchase screen, story pages and the menu countdown, each a switch), the local server, and Diagnostics and Help (environment check and error codes).
- **About** - the version, Check for updates, and the credits, including Cloud23333's original FGOLocalPlatform.

Getting Servants

The in-game summon works: it draws from the local server's card pool with the weights set on the launcher's Draw Rates page, one credit per pull, and the platform gives you free credits. You do not need it for a full roster, though - the launcher can grant everything at once:

- **Account page**: select an account and use One-Click Inventory and Growth to grant a full set of Servants, Craft Essences, levels, bond, costumes, and clear rewards at once.
- **Cards and Deck page**: build a deck from the full card library. Drag a card into the deck to add one copy, or double-click it to choose its art and how many copies; drag a deck card to reorder it, or back into the library to remove it. The deck is published to the game every time you press Play.
- **Draw Rates page**: sets the weight the local server gives each card when the in-game summon draws. It does not grant anything by itself.

Sharing decks and draw rates

Copy code on the Cards page puts the current deck on the clipboard as one line of text to paste in chat, with its order, copies and loadout name. Paste a code into the box beside it and press Import code or Enter: the deck loads with the cards your card folder has, and is saved as a new loadout, never over one you have. A damaged code, or one from a newer launcher, is refused with the reason.

A deck loadout (Cards and Deck > Loadouts > Save as) and a draw-rate preset (Draw Rates > Presets > Save as) are small .json files. Export puts a copy on your Desktop to send to anyone with the launcher; they click Import and it joins their list and loads. Keep as many as you like; Load switches between them any time. A loadout names the cards, so it works on any install; a card you do not have yet is left out and the launcher says how many. A preset is keyed by card id and works the same way. Your own files live under App\deck-loadouts and Server\artemis\config\summon-presets, and updates never touch them.

Playing

Controls

Action	Keyboard	XInput	DualSense (native)
Move	W / A / S / D	Left stick	Left stick
Dash	Left Shift	-	-
Switch target	F	-	-
Attack	Right mouse button	-	-
Noble Phantasm	Space	-	-
Recenter camera	C	-	-
Scan Aime card	Enter (hold)	-	-
Test menu (Operator menu keys on)	F1	-	-
Service menu (Operator menu keys on)	F2	-	-
Coin	F3	-	-

Full button mappings for XInput and DualSense are set on the launcher's Controls page, along with dead zone, controller index, and rumble strength. For DualSense, choose **PS5 DualSense (native)** on Controls, then **Detect Controller** and **Test Rumble** to confirm the right pad is selected before starting the game. If you already use DS4Windows or Steam Input to present the pad as an Xbox controller, keep XInput mode instead. Menus in the game are touch-driven, so they are worked with a mouse (or the touch screen on real arcade hardware) - left click selects, regardless of which control mode is active for play. With Cloud23333's latest update, the controller modes hide the mouse pointer in battle, story scenes inside a quest included: choose Keyboard and Mouse to use the mouse there.

A sortie, step by step

1. **Load Deck** - press the Load Deck button at the bottom-left of the main menu; the game reads the deck you built in the launcher. The Aime login itself happens automatically at the title screen.
2. **Formation** - set up your party from the Servants on the card.
3. **Terminal** - pick the chapter or event.
4. **Quest** - pick a quest from the list.
5. **Start** - confirm the sortie and fight; controls are as in the table above.

After the tutorial finishes, restart the game once before your first real sortie - this is a known quirk of the tutorial-to-main-menu handoff, and a restart clears it.

Exchange shops

The local server restores two in-game shops:

- **Costume Shop** - trade costume fragments, 175 items.
- **Item Exchange** - trade material tickets, 80 items; resets monthly on the 1st at 07:00 JST.

Known limits

- No online service - everything runs against the local server.
- Some artwork is still Japanese - event and boss banners, parts of the event screens and shops, and some buttons and labels; these are pictures, not text, and the game's text is English.

Troubleshooting

Error	Fix
4102	Server unreachable - start it from the Play page and wait for it to report ready. If it keeps happening on V1.01, update to Cloud23333's V1.02, which fixes it.
8404 at boot	The game's own Startup Mode was saved as Satellite (Sub Unit). Turn on Operator menu keys (F1, F2) on the Controls page and press Play, then on the error screen press F1 for the Game Test Menu (F2 moves the arrow, F1 confirms), open Game Settings, set Startup Mode to Main Unit, then Exit.
Cannot use Aime card, at the title	The first message to the local server timed out on that boot - close the game, check the server shows ready, press Play again.
0x80131515 at Play	Windows marked `App\FGO_Runtime.dll` as downloaded. The launcher clears the mark itself; if it comes back, right-click the file, Properties, tick Unblock.
"Some of the files the game needs are missing"	The zip was not unzipped into the game folder itself, or the folder never had Cloud23333's V1.01 update - unzip beside `App` and `Server`, and apply V1.01 or V1.02 first.
The game window opens and closes again (exit code 22)	Try windowed 1280x720 on the primary monitor; when reporting it, attach `logs\ago-crash-*.dmp` with your graphics card and driver version.
"Update failed" at the end of Cloud23333's V1.02 updater	His files are in place; only the last step (recovering Servants enhanced before V1.02) stopped, because his bundled Python points at a folder that exists only on his PC. Run FGOAC scooby as usual. To run that recovery anyway: `Server\python\python.exe Server\tools\repair_fgo_grail.py --logs logs --report logs\grail-recovery.json --apply` from the game folder.
4104	The install is on drive E: or Y: - move the whole folder to any other drive.
4105	The game was not run as administrator - click Yes on the UAC prompt.
0xC0000005, a few seconds after launch	Windows Defender Controlled Folder Access is blocking the game folder - add the game folder (or the exe) to the allowed list.
Black screen at launch	Almost always the NVIDIA driver, not the patch - update it and try again.

Error	Fix
Exit code 22 with 0xC000001D right after start	The CPU has no F16C. Not fixable on that CPU.
ERROR 6401 at start with a controller or a USB device	Players report this goes away with Windows USB selective suspend turned off (Power Options > Change plan settings > Change advanced power settings > USB settings).
The launcher says the folder never had V1.01, or that fgohook.dll is still 11.00	Unzip Cloud23333's V1.02 over the game folder and let it overwrite, then start the launcher again.
No cards after the first run, ERROR 0949, or ERROR 0087 with the game on a Storage Spaces or ReFS drive	A RAR part failed to extract, or the drive refuses the game's save writes. Re-extract the base game and let it overwrite; keep the install on a plain NTFS drive.
Google Drive renamed the RAR parts (part1-003 and so on)	Rename them back to FGOA_Cloud23333.part1.rar, part2.rar ... and unzip the small zip to get part5.rar before extracting part1.
Download links from 123 Pan	Not Cloud23333's. Use the links in his Bilibili description only.

Other notes:

- **Windows Firewall** may prompt once for the server's Python process and once for the game - allow both. The launcher creates these rules itself on first run; the prompt is only a fallback.
- **Settings > Diagnostics and Help** lists every error code with its fix - check it first.
- To report a problem, say which screen you were on and what you expected, then open the Status menu on Play and choose **Save a report**. It saves one zip - the game log, the logs folder's logs, the settings and the newest crash dumps, with your card number taken out - to attach. Nothing is uploaded; you send the file yourself.

Credits

- **Cloud23333** wrote the FGO Arcade local platform - the server package, the launcher (FGOLocalPlatform) that FGOAC scooby is built from, and the file hook this patch loads through. His package is free; if anyone sold it to you, ask for your money back.
- **fluphus** wrote the AMD layer fgo-arcade-amd-shim, parts of which Cloud23333's graphics layer builds on.
- The **FGO Arcade wiki** and **Atlas Academy** gave the official English names for Servants, Craft Essences, skills, and items.
- FGO Arcade belongs to **Sega** and **TYPE-MOON**. This is a fan translation applied to files you already have, and it is not sold.
